

5 Flashlight Positions

01. FBI

Involves gripping the pistol with one hand while keeping the other arm extended at around a 45° angle.

02. FBI Modified

This position differs from the previous one solely in the bending of the elbow of the arm holding the light. This makes the position more sustainable over longer periods.

03. Neck Index

Requires the least cognitive effort from the shooter. The light is literally touching the shooter's neck, so wherever the shooter turns his head, the light follows.

04. Harries

The backs of the hands meet, creating opposing forces that are theoretically meant to help mitigate recoil, offering some of the benefits of a two-handed grip.

05. Surefire

hold the flashlight between your fingers, pressing it against the palm of your hand as if it were a syringe. The remaining fingers are used to create a partial grip on the pistol.
